Advanced GCE

**CHEMISTRY A**

Unit F326: Practical Skills in Chemistry 2:  
Evaluative Task

**Specimen Task**

**For use from September 2008 to June 2009.**

Candidates answer on this task sheet.

## F326 (3)

### INSTRUCTIONS TO CANDIDATES

- Answer **all** parts of the task.

### INFORMATION FOR CANDIDATES

- The number of marks is given in brackets [ ] at the end of each part of the task.
- The total number of marks for this task is **15**.

### INFORMATION FOR TEACHERS

- Before carrying out this task, it would normally be expected that candidates will have carried out Unit F326 Task 2: '*Determination of the formula of hydrated iron(II) sulfate*'.

### ADVICE TO CANDIDATES

- Read each part carefully and make sure you know what you have to do before starting your answer.

FOR TEACHER'S USE		
Part	Max.	Mark
C1	5	
C3	5	
C4	5	
<b>TOTAL</b>	<b>15</b>	

This task consists of **7** printed pages and **1** blank page.

### Water of crystallisation

A student carried out an experiment to determine the value of  $x$  in hydrated iron(II) nitrate  $\text{Fe}(\text{NO}_3)_2 \cdot x\text{H}_2\text{O}$ .

The student first prepared an aqueous solution by dissolving 3.60 g of  $\text{Fe}(\text{NO}_3)_2 \cdot x\text{H}_2\text{O}$  in water and making up the solution to  $250.0 \text{ cm}^3$  in a volumetric flask.

The student then determined  $x$  by two methods.

#### 1 Titration

A  $25.0 \text{ cm}^3$  sample of this solution was measured using a pipette. The solution was acidified and then titrated with a standard solution of potassium manganate(VII).

The process was repeated until consistent titres had been obtained.

From the results, the value of  $x$  in  $\text{Fe}(\text{NO}_3)_2 \cdot x\text{H}_2\text{O}$  was determined.

#### 2 Displacement

A  $25.0 \text{ cm}^3$  sample of this solution was taken and a more reactive metal was added, displacing the iron in a redox reaction.

The student chose a suitable metal from redox systems below.

The iron obtained was filtered off, washed with distilled water and dried. The iron was then weighed as follows.

Mass of empty weighing bottle = 20.16 g

Mass of weighing bottle + iron = 20.23 g

From the results, the value of  $x$  in  $\text{Fe}(\text{NO}_3)_2 \cdot x\text{H}_2\text{O}$  was determined.

**Analysis**

- (a) Choose a suitable metal that could be used for the displacement reaction.

Justify your answer in terms of electrode potentials and write an equation for the displacement reaction.

.....  
.....  
.....  
.....  
.....

..... C1 [3]

- (b) In the displacement experiment, 0.00125 mol of Fe was obtained.

Use this amount of Fe to help you calculate the value of  $x$  in  $\text{Fe}(\text{NO}_3)_2 \cdot x\text{H}_2\text{O}$ .

Show all your working.

SPECIMEN

C1 [2]

[Turn over

(c) The titration method gives a more reliable and accurate result for  $x$  than the displacement method.

(i) State and explain **two** reasons for this.

.....  
.....  
.....  
.....  
.....

..... C3 [2]

(ii) Suggest **two** modifications to the displacement reaction that would produce more reliable and accurate results.

.....  
.....  
.....  
.....  
.....

..... C4 [2]

SPECIMEN

- (d) The value of  $x$  could also be determined by heating the hydrated compound to drive off the water of crystallisation to obtain anhydrous iron(II) nitrate.

A problem with this approach is that the anhydrous iron(II) nitrate will further decompose to iron(II) oxide. This is shown in **equation 2.1** below.

Some of the anhydrous iron(II) nitrate is likely to decompose in this way.

- (i) Explain the most likely effect of further decomposition on the value of  $x$  obtained from this method.

.....  
 .....  
 ..... C3 [1]

- (ii) A student suggested that this approach could still be used to obtain an accurate value of  $x$  by strongly heating the  $\text{Fe}(\text{NO}_3)_2 \cdot x\text{H}_2\text{O}$  until it had all decomposed into iron(II) oxide.

Explain, with a reason whether you agree with the student.

.....  
 .....  
 ..... C3 [1]

- (iii) Iron(II) oxide,  $\text{FeO}$ , readily oxidises in the air to form iron(III) oxide,  $\text{Fe}_2\text{O}_3$ . This reaction takes place slowly.

What would be most likely effect on the value of  $x$  obtained if some of the iron(II) oxide was oxidised? Explain your answer.

.....  
 .....  
 ..... C3 [1]

[Turn over

- (e) Another modification to the experiment in (d) would be to work out the mass of water that was released.
  - (i) Draw a labelled diagram to show how this could be carried out experimentally.

C4 [2]

- (ii) The student suggested that any further decomposition, as in **equation 2.1**, would then not matter using this modification.

Explain, with a reason whether you agree with the student.

.....

.....

..... C4 [1]

C1: 5; C3: 5; C4 5 [Total: 15]

**F326 (3)**

Unit F326: Practical Skills in Chemistry 2: Evaluative Task

**Instructions for Teachers and Technicians**

**For use from September 2008 to June 2009.**

SPECIMEN

**This is an Evaluative Task. There is no time limit but it is expected that it can be completed within one hour.**

Candidates may attempt more than one Evaluative task with the best mark from this type of task being used to make up the overall mark for Unit F326.

### **Preparing for the assessment**

It is expected that before candidates attempt Practical Skills in Chemistry 2 (Unit F326) they will have had some general preparation in their lessons. They will be assessed on a number of qualities such as recognising and interpreting data, identifying anomalies and reaching valid conclusions, assessing the reliability and accuracy of an experimental task, identifying significant weaknesses in experimental procedures and measurements, and understanding and selecting simple improvements to experimental procedures and measurements. It is therefore essential that they should have some advance practice in these areas so that they can maximise their attainment.

### **Preparing candidates**

At the start of the task the candidates should be given the task sheet.

Candidates must work on the task individually under controlled conditions with the completed task being submitted to the teacher at the end of the lesson. Completed tasks should be kept under secure conditions until results are issued by OCR.

Candidates should not be given the opportunity to redraft their work, as this is likely to require an input of specific advice. If a teacher feels that a candidate has under-performed, the candidate may be given an **alternative** task. In such cases it is essential that the candidate be given detailed feedback on the completed assessment before undertaking another Evaluative Task. Candidates are permitted to take each task **once** only.

### **Assessing the candidate's work**

The mark scheme supplied with this pack should be used to determine a candidate's mark out of a total of 15 marks. The cover sheet for the task contains a grid for ease of recording marks. To aid moderators it is preferable that teachers mark work using red ink, including any appropriate annotations to support the award of marks.
